

USER INTERFACE DESIGN

EXPERIMENT 8

HARRISH LS 240701178

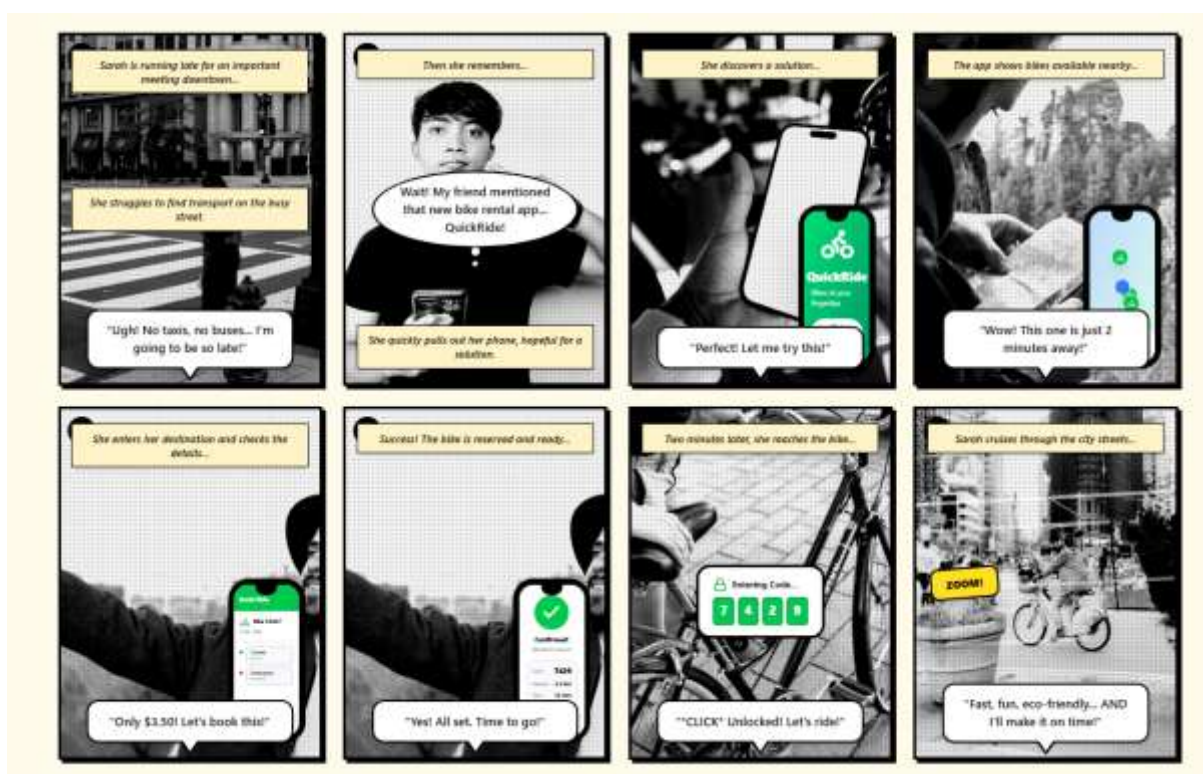

To design a storyboard representing the user flow of a **Bike Riding Mobile Application** using low-fidelity prototyping techniques and comic-style visualization.

Tools Used

FIGMA (for storyboard design)

User Scenario

Sarah is running late for an important meeting and is unable to find transportation. She discovers a bike riding app, uses it to locate a nearby bike, books it, and successfully reaches her destination on time.

Storyboard Flow Explanation

Step 1: Problem Identification

The user is waiting on the street and unable to find transportation. She feels frustrated and worried about being late.

Step 2: Idea / Discovery

The user remembers a bike rental application suggested by a friend and decides to try it.

Step 3: App Launch

The user opens the application on her phone and is introduced to the app interface.

Step 4: Finding Nearby Bikes

The app displays available bikes near the user's location on a map.

The user selects a nearby bike.

Step 5: Booking the Ride

The user enters the destination and checks ride details such as cost and distance.

She confirms the booking.

Step 6: Confirmation

The app confirms the booking and provides an unlock code and ride details.

Step 7: Ride Start

The user reaches the bike, enters the unlock code, and starts the ride.

Step 8: Successful Outcome

The user rides the bike and reaches the destination happily, solving her problem efficiently.

A complete storyboard was successfully created to represent the user flow of a bike riding application. The storyboard effectively communicates the problem, user interaction, and solution in a visually engaging comic format.
